Attendance

I am a modern attendance system that in addition to standard situations primarily addresses the individual needs of each customer. My output is WHO, WHEN, WHERE, HOW, WHOM and WHERE TO. I collect information about arrivals and departures, from which I create attendance. I submit attendance for approval and then generate an easy to work with output. The data connection with my other modules is unique.

Data acquisition:

I collect information from reception terminals, lobbies, CH Cells or mobile attendance. As well as via an app from all Android devices, mobile phones or other devices with an Internet connection.

And more:

- I verify the person who creates the attendance
- I record the specific place where the attendance was taken
- I record the time when the attendance was taken
- I identify the device on which the attendance was taken

Processing:

From the data of arrival and departure I process attendance according to individual settings.

And more:

- I round off the start and end of attendance according to a set discriminator
- I automatically create breaks according to the settings with respect to the potential actual break
- I can immediately inform the responsible person about overtime, weekend, off-shift or night work

Approval:

I submit the created attendance to the responsible person for approval.

And more:

- I allow the responsible person to make a correction
- I allow the responsible person to approve attendance on an ongoing basis
- I show approved attendance and possible corrections to employees continuously
- I clearly display approved attendance

Export:

From approved attendance, I create a time sheet, which I export to Excel or directly to the format you need for further processing.

I am Adam – an assistant software with a modern attendance system
